

TDM V9.3.1 HF1 RELEASE NOTES

- These Release Notes describe the enhancements and bug fixes that have been implemented since the V9.3.1 release.
- Certification of this TDM release is based on:
 - Fabric 8.2.5
 - PostgreSQL 17

MAIN FEATURES AND IMPROVEMENTS

1. TDM DB Handling

- Previous TDM version - 9.3.1 - changed the TDM DB handling and set the TDM DB schema name in a new ConstTable type (TDMDBSchema Actor) instead of in the TDMDB_SCHEMA Global. TDM 9.3.1 HF1 reverts this change and uses the TDMDB_SCHEMA Global instead of the TDMDBSchema Actor. The TDM re-uses the TDMDB_SCHEMA Global in order to simplify the TDM upgrade process.

RESOLVED ISSUES

- Ticket #43442 - fixing the StatsLoader actor error when running the DbLoad actor in Upsert or Update mode.
- Ticket #43738 – fixing the backend and frontend synchronization in the TDM self-service (TDM portal).
